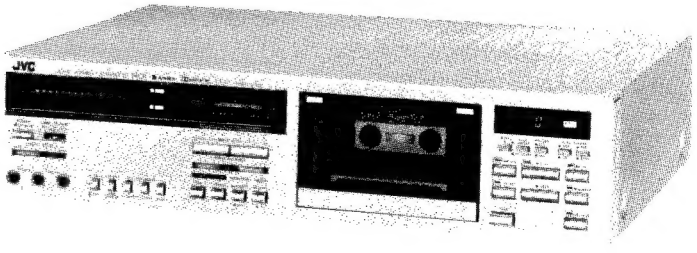
SERVICE MANUAL

MODEL

DD-9 A/B/C/E/J/U

STEREO CASSETTE DECK



No. 4198
March 1981

Contents

Features

- 2-motor full-logic mechanism with quartz-locked pulse-servo D.D. motor
  - A quartz-locked pulse-servo D.D. motor newly developed for capstan drive and a DC motor for reel drive
  - Low wow/flutter (WRMS 0.019%)
  - TIMER STANDBY mechanism (with maloperation protection)
  - AUTO-REWIND mechanism
  - Remote control terminal provided (R-50E optional)
- Built-in computer B.E.S.T. tuning system for automatic adjustment of Bias, Equalization and Sensitivity of tape
- Metal tape compatible
- Three-head system permitting monitoring while recording is being made
  - X-cut SA (Sen-Alloy) combination record/playback head
  - 2-gap SA erase head
- 2-color FL digital meter (PEAK/VU selectable) with peak hold function
- DC configured record/playback amplifier
- Electronic control for recording level adjustment
- Equipped with ANRS/DOLBY B and DOLBY C NR moise reduction systems.
- Timer standby capability for automatic recording or playback using an AC timer
- Headphones in connection with slide system output level control
- Record muting (REC MUTE) mechanism (with operation indicator LED)
- New slim design with push button switches

Specifications

Type : Component stereo cassette deck
Track system : 4-track, 2-channel
Tape speed : 1-7/8 inch/sec (4.8 cm/sec)
Frequency response :
(−20 VU recording)
Metal tape *1; 15–20,000 Hz
25–18,000 Hz (± 3 dB)
SA/Chrome tape *2; 15–20,000 Hz
25–18,000 Hz (± 3 dB)
SF/Normal tape *3; 15–19,000 Hz
25–17,000 Hz (± 3 dB)
(0 VU recording)
Metal tape ; 25–12,500 Hz (± 3 dB)
SA/Chrome tape ; 25–8,000 Hz (± 3 dB)
SF/Normal tape ; 25–8,000 Hz (± 3 dB)
Frequency response when using the computer B.E.S.T. tuning system:
(−20 VU recording)
Metal tape ; 40–12,500 Hz (± 1 dB)
SA/Chrome tape ; 40–12,500 Hz (± 1 dB)
SF/Normal tape ; 40–12,500 Hz (± 1 dB)
Those values are almost the same for all types of tapes when the computer B.E.S.T. tuning system is used.
Note: *1 ..... JVC ME or Equivalent
*2 ..... TDK SA or Equivalent
*3 ..... MAXELL UD or Equivalent
S/N ratio ; 60 dB (DIN 45 500 weighted, Metal tape)
NR effect ; 5 dB at 1 kHz, 10 dB at 5 kHz (ANRS/Dolby B NR)
15 dB at 500 Hz, 20 dB at 1 kHz (Dolby C NR)
Wow and flutter : 0.019% (WRMS) with JVC test tape
0.055% (DIN 45500) with MAXELL UD tape
Crosstalk : 65 dB (1 kHz)
Harmonic distortion : K3; 0.4%, THD; 1.0%
(Metal tape, 1 kHz, 0 VU)

Bias : AC bias
Erasure : AC erasure
Heads : 3 heads
SEN ALLOY head for recording, SEN ALLOY X-cut type for playback and two-gap SEN ALLOY head for erasure
Motors : Quartz-lock pulse servo DD motor (for Capstan)
DC motor (for Reel)
Fast forward time : 85 sec or less with C-60 cassette
Rewind time : 85 sec or less with C-60 cassette
Semiconductors : 45 ICs, 140 transistors, 88 diodes, 2 hall IC, 18 LEDs
Input terminals :
Mic jack x 2 ; Max. sensitivity; 0.2 mV (−72 dBs)
Matching impedance; 600 Ω ~ 10 kΩ
Input jack x 2 ; Min. input level; 80 mV (−20 dBs)
Input impedance; 100 kΩ
Output terminals :
Output jack x 2 ; Output level; 0 ~ 500 mV
Output impedance; 5 kΩ
Phone jack x 1 ; Output level; 0 ~ 0.6 mW/8 Ω
Matching impedance; 8 Ω ~ 1 kΩ
Remote control socket: 8 pin DIN type (for R-50E optional)
Power requirement : AC 240 V, 50 Hz (DD-9A)
AC 120 V, 50 Hz (DD-9C/J)
AC 240/220/120 V, 50/60 Hz (DD-9B/E)
AC 240/220/120/100 V, 50/60 Hz (DD-9U)
Power consumption : 40 W
Dimensions : 17-3/4" (450 mm) W
12-3/4" (325 mm) D
4-3/8" (110 mm) H
(with feet, buttons, switches)
Weight : 18.5 lbs (8.4 kg)

Design and specifications subject to change without notice.

Maintenance

To get long, trouble-free service, maintenance is important. Do not forget cleaning and demagnetizing.

Cleaning

After long use, the heads and tape part – capstan, pinch roller, etc. – will become dirty with dust or magnetic particles. Dirty heads cause imperfect erasing or high frequency drop-off. A dirty capstan and pinch roller will cause unstable tape speed, leading to increased wow and flutter. Always keep them clean by following the procedure below.

1. Heads

1) Push Eject button to open the cassette holder.
2) Use the head cleaning stick provided to wipe the surface where the tape comes into contact with the head. (It is effective to moisten the cotton with alcohol.)

2. Pinch roller and capstan

Do the same method as heads.

3. Cabinet

When the cabinet becomes dirty, wipe it with a soft cloth soaked with a neutral cleaning solution of a polishing cloth.

* Do not use thinner or benzine.

Demagnetizing

The heads are made from a material resistant to magnetization, but after long use they may become magnetized. A magnet brought into their vicinity can magnetize the heads, causing excess noise. If noise seems to have increased, demagnetize the heads with a head demagnetizer through the following procedure.

1. Turn the POWER switch OFF.
2. Wrap the tip of the demagnetizer with vinyl tape or soft cloth so as not to damage the head surface. Switch on the demagnetizer and bring it close to the head.
3. Move the tip of the demagnetizer slowly first to the left and right, then up and down in front of the head. Gradually move it away from the head and switch it off at a distance of more than 30 cm (12").
4. The erase head need not be demagnetized. The capstan shaft and tape guide should be demagnetized in the same way as the record/playback head.

* Do not bring a magnetized metallic object (a screwdriver, for example) near the head as this will increase noise.

Description on New Technology

■ **DD (Direct Drive) Mechanism Equipped with Newly Developed Quartz-locked Pulse Servo DD Motor**

A direct drive system is employed in which the motor shaft itself is the capstan shaft, without the rotation transmitting members (idlers, pulleys, etc.) which cause unstable tape rotation. Our newly developed pulse servo motor is employed for this driving power source.
The motor's construction is free from thrust unbalance or cogging, thus permitting a high flywheel effect. For precise rotation, this motor uses a full-circumference integration type FG detection system and an auto-balance circuit which reduces torque unbalance. Thus, the motor drives the tape transport mechanism with smooth rotation. Further, the employment of the quartz lock system results in exceedingly small fluctuation of speed.
For detailed information, refer to service manual (No. 4195)for DD-7.

■ **Three-head System with X-cut SA Record/Playback Combination Head**

The record head uses a 4μ-gap SA head for improved recording sensitivity and a reduced distortion rate. The playback head uses an X-cut 1μ-gap SA head for reduced low-frequency contour effect. These two heads are combined. The erase head employs a 2-gap SA head excellent in erasure efficiency. For more details, refer to page 5 in service manual (No. 4186) for KD-A77.

■ **All-stage DC Configurated Amplifiers**

The playback head and the equalizer amplifier are directly coupled. Since all stages between amplifiers are DC configured, the number of the capacitors which adversely affect sound quality, is decreased. In addition, the ±2 V constant voltage source and the differential amplifier enable stable high linearity and wide-band reproduction.

■ **Dot-matrix Type 2-color FL (fluorescent tube) Peak Level Meter**

The 2-color fluorescent indicator tube which is longest at 135 mm among cassette decks. The R and L indicator bars are independent of each other. Each bar is divided into 18 segments, each further into 20 dots. So, the level can be monitored with a feeling of a consecutive bar graph.
This meter is provided with a peak-hold function, thus facilitating level setting. Moreover, it has a selection switch between the PEAK and VU meters.

■ **Memory Stop and Auto-rewind**

By joint use of the MEMORY switch, AUTO REWIND switch (PLAY/STOP) and the electronic counter, the following operations are possible:
Continuous tune repeat between the beginning of the tape and the point of the tape at which the MEMORY switch is pressed; tune repeat between "000" to which the counter is reset by the RESET switch and the point of the tape at which the MEMORY switch is pressed or between this point of the tape and the end of the tape.
Needless to say, the conventional functions can be performed by ON-OFF operation of the MEMORY switch or the AUTO-REWIND switch (ON/OFF) singly.

■ **Electronic Volume Control**

Motor rotation is controlled by switching the polarity by IC so that the input volume can be set by one-touch recording level UP-DOWN operation.
The set recording level is indicated by the needle which moves in response to the control motor.

■ **Newly Developed Computer B.E.S.T. (Bias Equalizer Sensitivity Tuning) System 3-head Tape Deck**

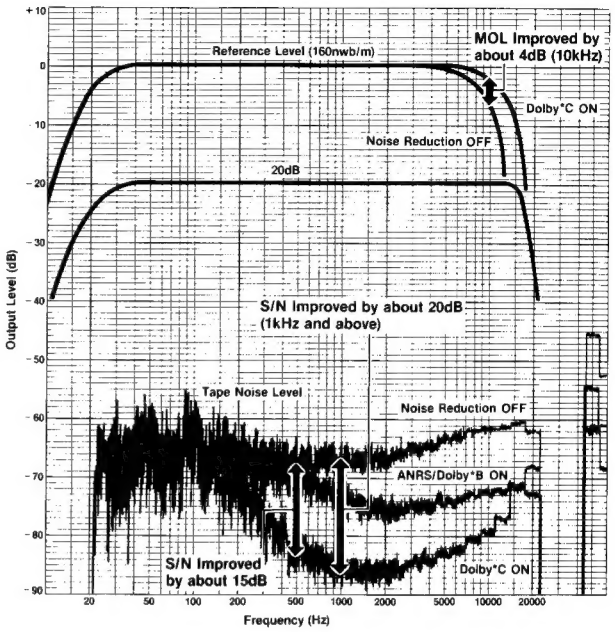
This system was developed for 3-head tape deck utilliz-ing the fundamental concept of the previous versions KD-A8 and KD-A66.
With stress laid upon MOL balance, the bias level is set at the average of the optimum bias points which are detected at 16 steps each for R and L channels.
To control the medium-frequency response, a process to make the 4 kHz/1 kHz response flat is provided. This response is set at the average between those R and L values which are taken each at 8 steps.
The tape sensitivity is set at an average of those R and L values which are taken at 16 steps each. The high-frequency equalization level is adjusted at 16 steps each for R and L channels, independently.
In addition, since the A/D conversion system of the detection signal has been changed from the peak-hold type to the soft peak-hold type, a momentary pulse due to noise is not detected. Therefore, this system is designed to hold nothing but continuous signals.

Dolby* C-Type Noise Reduction System: Noise is reduced and MOL increased dramatically.

The Dolby C-type closely resembles the B-type in operation, the system compatible with ANRS, yet offers even better performance and more distinctive features. Namely:

- It provides about 20 dB above 1 kHz, and 15 dB even at 500 Hz of noise reduction.
- At 10 kHz (at 0 VU recording), it improves MOL by 4 dB maximum.
- It is immune to undesirable side effects, such as modulation noise and breathing.
- Finally, it is tolerant of noise reduction encode/decode errors. Level matching is not critical.

(*Dolby is a trademark of Dolby Laboratories, Inc.)



Dolby* C Improvement

The basis of C-type noise reduction

Dolby C noise reduction solves the problem of achieving a large amount of compression and expansion without introducing undesirable side effects by the use of two processing stages in series, each supplying 10 dB of compression during recording and of expansion during playback. These circuits operate at independent levels. One, identified as the high-level stage in Figure B, is sensitive to signals at about the same levels as Dolby B-type noise reduction, while the other, the low-level stage, operates on signals of somewhat lower level. Because the two stages operate in tandem with each other, their effect is to multiply the signals (or add and subtract in dB's), so that a total of 20 dB of compression and expansion, and thus of noise reduction, is accomplished. Yet simultaneously, at no time is the signal subject to the vagaries of a single compression or expansion action of 20 dB. In other words, the tandem two-level, two-stage configuration provides a much more accurate control of the signal than a single compander circuit would be able to achieve.

Two conventional Dolby B IC circuits are used in a modified way in C-type noise reduction to carry out the two-level, two-stage scheme. Thus a desirable side benefit of C-type noise reduction is that it can be executed from the beginning with readily available and economical parts (the development of a dedicated Dolby C integrated circuit in the future would, however, simplify incorporating C-type NR in products). Furthermore, one of the two stages can be easily configured to provide the B-type characteristic at the push of a switch, so cassette decks incorporating C-type noise reduction can be economically equipped with Dolby B NR as well for perfect compatibility with existing B-type recordings.

Other developments

In addition to two-level processing, Dolby C-type noise reduction incorporates a number of further innovations. Two of these, shown in Figure B as anti-saturation and spectral skewing networks, are carefully calculated frequency response modifications introduced in the encoding (record) process and reciprocally compensated for in the decode (playback) process. Their purpose is two-fold: to further guard against audible side effects, and to ensure the practicality of the system in day-to-day consumer use. The specific benefits of these innovations include the reduction of encode-decode errors and a reduction of upper-middle and high frequency tape saturation and its side effects, such as high frequency losses and intermodulation distortion. Together with the two-level, two-stage configuration, these new developments result in a 20 dB noise reduction system at least as free of side effects as the 10 dB B-type system, and one which is just as practical in day-to-day use.

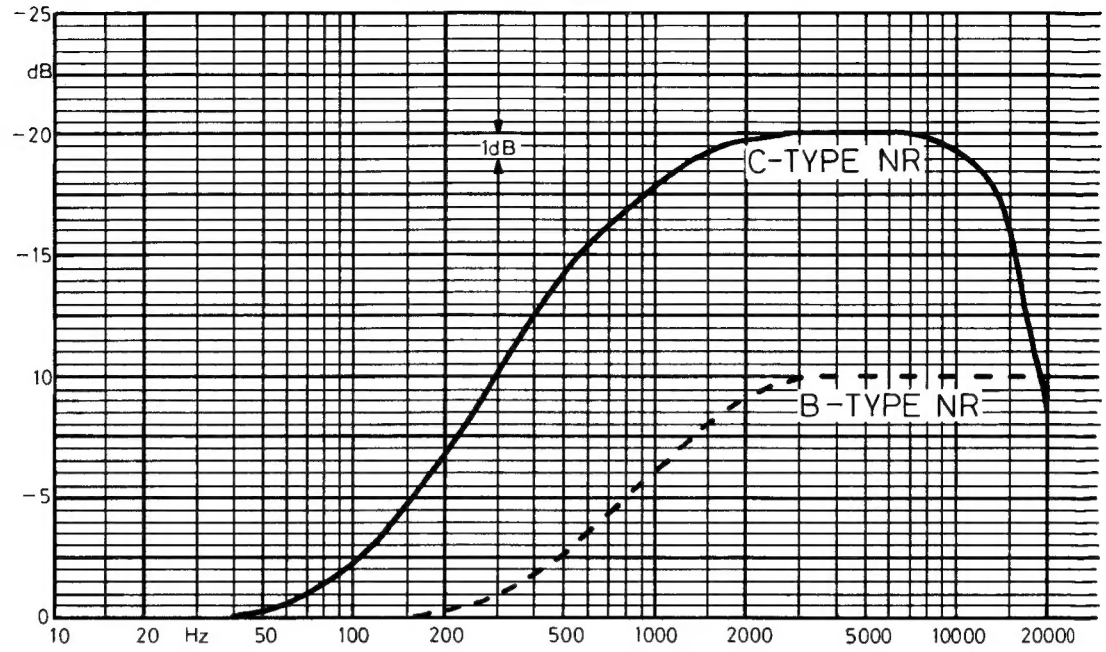


Fig. A Low-level encoding frequency response

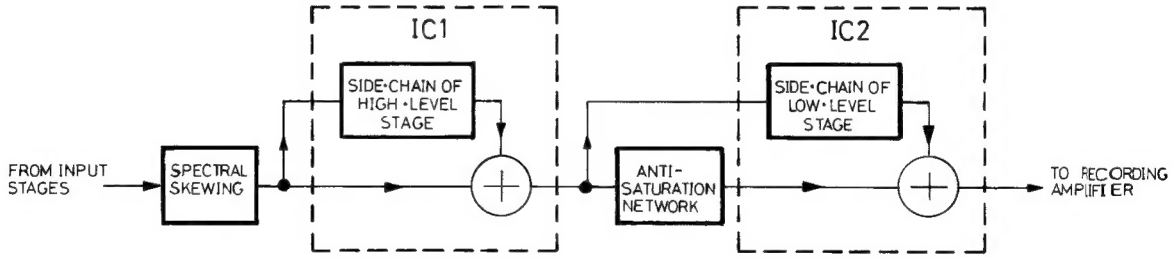
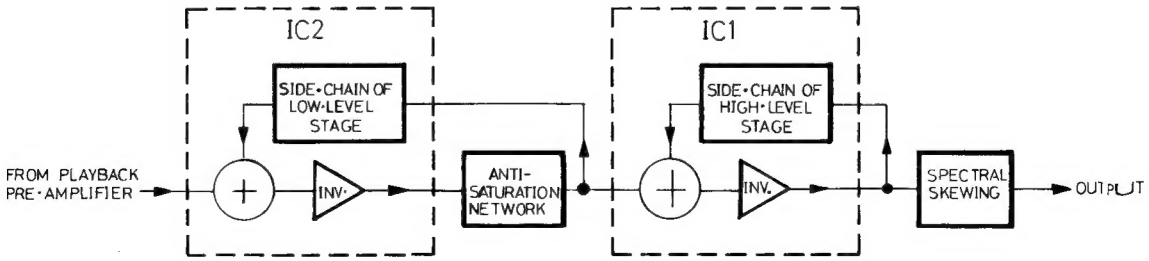
These curves, showing the maximum low-level boost imparted by both C-type and B-type noise reduction in the absence of high frequency signals, illustrate some of the similarities and differences between the two systems. Dolby C noise reduction imparts more boost in recording and more cut in playback, thus providing more noise reduction. The effect also extends about two octaves lower with C-type noise reduction to maintain subjectively uniform noise level across the spectrum. Processing at very low frequencies is not required with either system because low frequency noise is insignificant in properly engineered cassette recorders.



DOLBY C-TYPE ENCODER



DOLBY C-TYPE DECODER

Fig. B Dolby C-type NR block diagram

Features of New B.E.S.T. System

- **Bias Level Setting System with MOL Balance Taken into Consideration**

  With an 8 kHz variable normal or chrome tape, the difference in bias level between MML (333 Hz) and MOL (10 kHz) is set to 12 dB, while with a metal tape, it is set to around 8 dB. The MOL balance is thereby stabilized.

- **High-accuracy Bias, Equalization and Sensitivity Level Setting System**

  The accuracies of bias, sensitivity, medium and high frequency equalization levels are greatly improved through average calculation of reading error.

- **Second Bias System**

  With a special tape, the respective levels are readjusted by this system, thus their accuracies are assured.

- **4-bit 1-chip 2k ROM Microcomputer**

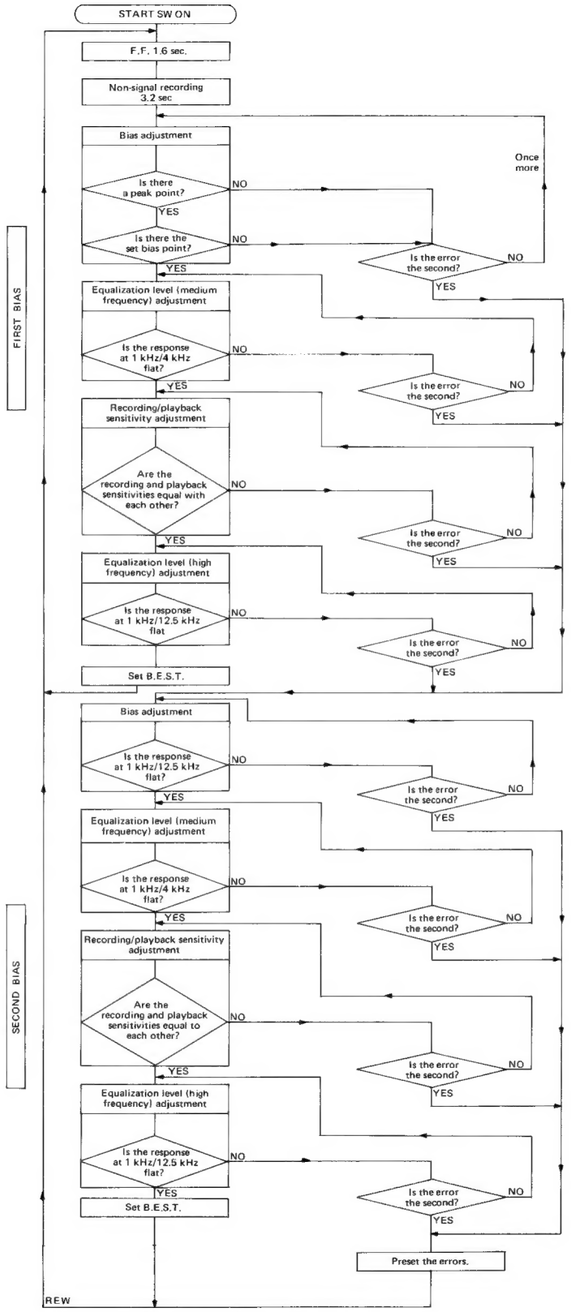


Fig. 5

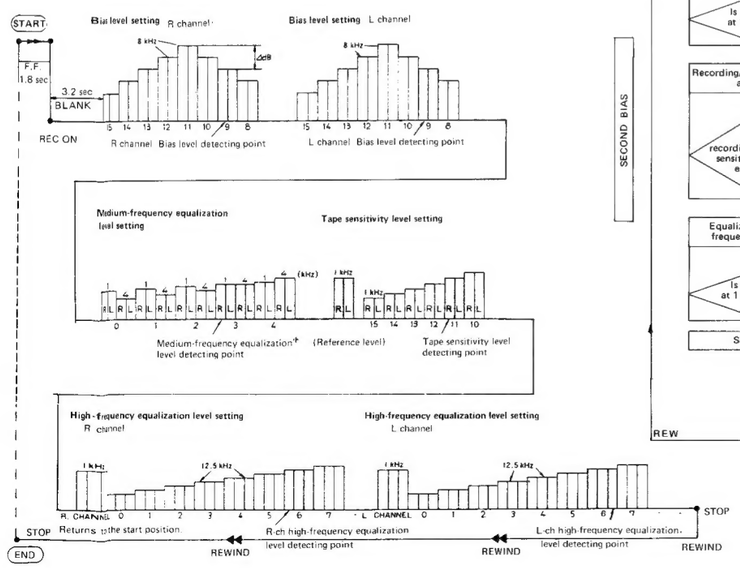

Fig. 4

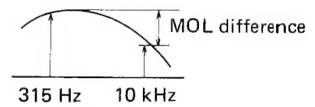
■ **Comparison Table between KD-A66 and DD-9**

Item	KD-A66	DD-9
Bias level (B)	(1) Coincident point of 7 kHz and 1 kHz (2) 8 steps (3) Detection at R channel	(1) The bias level is lowered by Δ dB due to the bias current characteristics, as the MOL balance is considered. (2) 16 steps (3) Average value between R and L channels
Medium-frequency equalization level (EQ M)		(1) Coincident point of 4 kHz and 1 kHz (2) 8 steps (3) Average value between R and L channels
High-frequency equalization level (EQ H)	(1) Coincident point of 12.5 kHz and 1 kHz (2) 8 steps (3) Detection at R and L channels	(1) Coincident point of 12.5 kHz and 1 kHz (2) 16 steps Recording is performed 3 times at each step. (3) Average value between R and L channels
Tape sensitivity level (S)	(1) Coincident point of recording and playback at 1 kHz (2) 8 steps (3) Detection at R channel	(1) Coincident point of recording and playback at 1 kHz (2) 16 steps (3) Average value between R and L channels
Required time	About 25 sec	About 30 sec (This time differs slightly according to the tape used.)
Microcomputer	4-bit 1-chip 2k ROM	4-bit 1-chip 2k ROM
Indications	PRESET/ERROR, RUN/READY	B, EQ M, S. EQ H, PRESET, ERROR
Memory	Not provided	Temporary memory
A/D conversion	Peak-hold type	Soft peak-hold type

■ **MOL balance**

With the linearity characteristics of the tape and the frequency components of the input signals taken into consideration to record musical signals at good balance, the difference between the low-frequency (315 Hz, K3 : 3%) MOL and high-frequency (10 kHz) saturation MOL (or SOL) is set to 12 dB on normal tapes and 8 dB on high-performance tapes such as metal tapes, etc.
Thus, the maximum recording level is determined and the bias current is set with a MOL difference.
Practically, a signal of 8 kHz is recorded based upon the data of various tapes and the MOL balance is determined by the bias current characteristics for this signal.



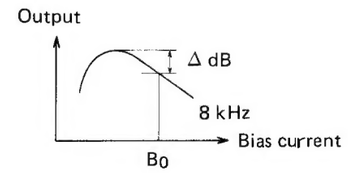


Fig. 6

Removal of the Main Parts

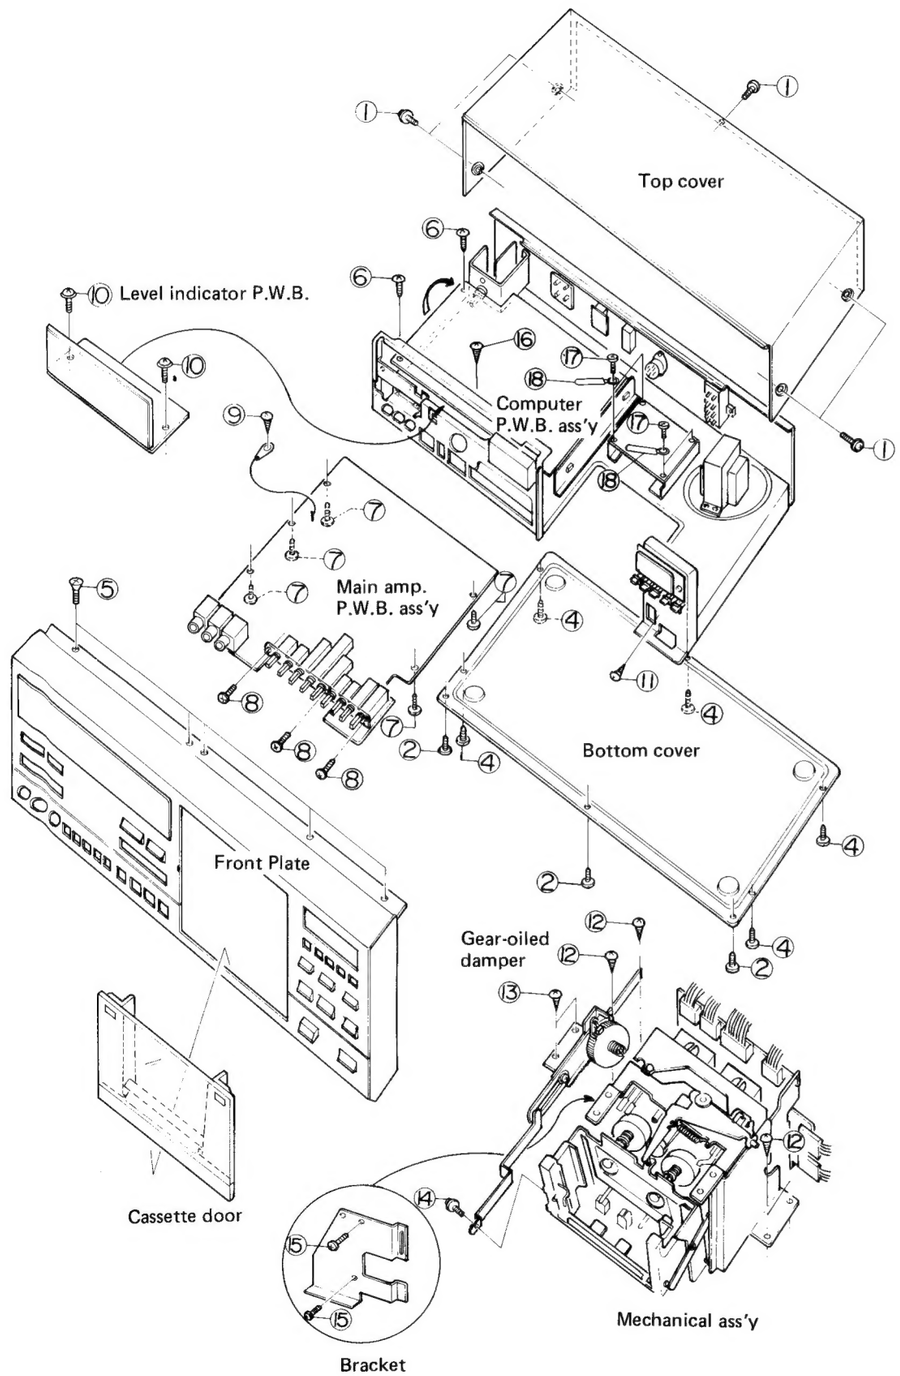

Fig. 7

Observe care in handling the parts since the parts are small in size and the distance between them are short due to a deck design aimed mainly at compactness and high performance.
(Remove in the order of steps 1, 2, 3, ...)

Enclosure assembly parts

1. Cassette door
   To open the cassette door, push on the eject button. Slide off the cassette door upwards.
2. Top cover
   Remove 5 screws (1) fastening the top cover (left and right ..... 2 screws on each and a screw on rear center).
3. Bottom cover
   (1) Remove 3 screws (2) (SDSP3008R) and a washer (3) (WNS4000S). – These screws are fastened with the front plate ass'y.
   (2) Remove 5 screws (4) fastening the bottom cover.
4. Front plate assembly
   Remove 5 screws (5) fastening the front plate upwards. – Enclosed 2 screws for mechanical assembly.

Electrical parts

When removing the wires from wire clamp (QHX2075-001), cut off its clamp. (This clamp cannot be used again, then apply a new clamp.)

1. Remove 2 screws (6) fastening the computer P.W. board. Open its P.W. board from left side.
2. Main amp P.W.B. ass'y
   (1) Remove 4 screws (7) fastening the main amp P.W. board on the bottom side.
   (2) Remove 3 screws (8) fastening the switches on the front side.
   (3) Remove a screw (9) fastening the bracket of the computer P.W. board on the right side.
   (4) Pull off its P.W. board to rear low side.
3. Level indicator P.W.B. ass'y
   (1) Remove 2 screws (10) fastening its P.W. board.
   (2) Remove a screw (16) fastening the bracket.
4. Counter P.W.B. ass'y
   Remove a screw (11) fastening its P.W. board on the rigjt side.
5. Power supply P.W.B. ass'y
   Remove 4 screws (17) and lugs (18) fastening the power supply P.W.B.
6. Electronic volume VR
   (1) Remove the front plate assembly.
   (2) Remove the level indicator P.W. board ass'y.
   (3) Remove the rope.
   (4) Remove the pulley.
   (5) Remove the computer P.W. board ass'y.
   (6) Unsolder 3 wires of V.R. board.
   (7) Remove a nut and a washer of shaft.
   (8) Unsolder the V.R. terminals.
7. Switches (Reset, Memory, etc.)
   (1) Remove the front plate assembly.
   (2) Remove each knob.
   (3) Remove the counter belt.
   (4) Remove a screw fastening the bracket of the pulley.
   (5) Remove 2 screws fastening the counter P.W. board.
   (6) Remove 5 screws fastening the switches.
   (7) Pull off the switch P.W.B. ass'y to rear side.

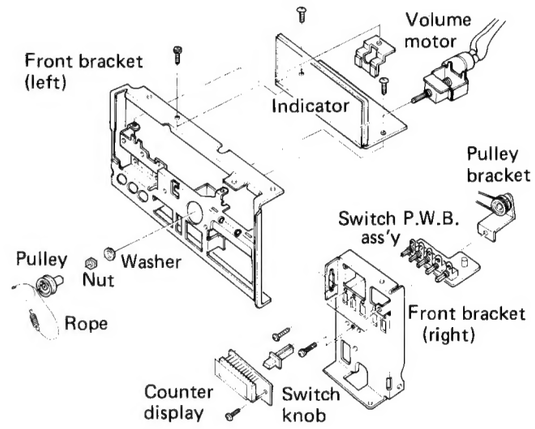

Fig. 8

Mechanical assembly

(When removing the front plate ass'y, remove 2 screws fastening the mechanical assembly upwards.)

1. Remove 4 screws (12) (left and right ..... 2 screws on each) fastening the mecha. assembly to the chassis.
2. Remove 2 screws (13) fastening the gear-oiled damper to the chassis.
3. Remove a screw fastening the arm of the gear-oiled damper.
   (When removing the cassette holder, to remove the left bracket, remove 2 screws (15) fastening its bracket.)
4. Remove 6 connectors on the mecha. control P.W. board.
5. Open the vinyl wire clamp for head wires on the chassis (bottom side).
6. Remove the counter belt.

Mechanical parts

Mechanical parts are the same as removal of model DD-7. Please refer to the service manual of DD-7A/B/C/E/J/U (No. 4195, page 10).

Main Adjustments

[I] Equipment and measuring instruments used for adjustment

1. Electrical adjustment

1) Electronic voltmeter
2) Audio frequency oscillator
   (range: 50—20 kHz and output 0 dB with impedance 600 Ω)
3) Attenuator
4) Standard tapes for REC/PB
   Maxell UD – SF tape . . . . . } or equivalent
   TDK SA – SA tape . . . . . } or equivalent
   JVC ME – Metal tape . . . . . } or equivalent
5) Reference tapes for playback (JVC Test Tape)
   VTT-658 (for head azimuth adj.)
   VTT-656A-S (for motor speed, wow flutter adj.)
   VTT-664 (for Reference Level 1 kHz)
   VTT-675N (for playback frequency response)
6) Resistor
   600 Ω (for attenuator matching)

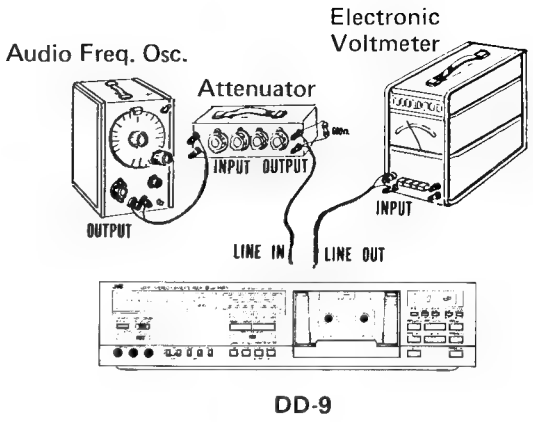

Fig. 9

2. Mechanical adjustment

1) Torque testing cassette gauge
2) Blank tape (C-120) for tape running checker.

[II] Mechanical adjustment

(Adjust the mechanism or confirm that it is in normal operating condition prior to the adjustment of the electrical circuit.)

Head adjustment

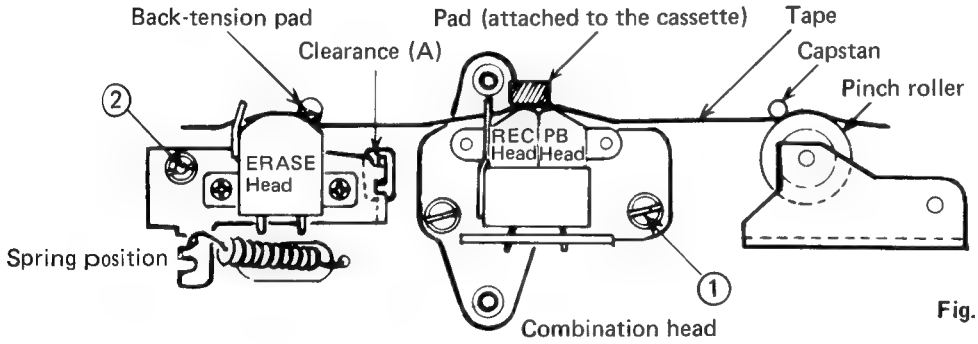

Fig. 10

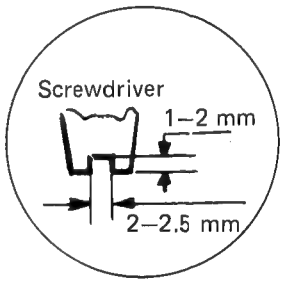

1. After installing the specified parts in the appropriate positions:
   A. Snug screw ① gently, then back off about two turns. This makes the heads nearly horizontal.
   B. Snug screw ② gently, then back off about one turn. This will roughly position the tape in the center of the tape path.
   For tightening screw ②, use a home make screwdriver, filed down to the specifications shown below. The same screwdriver can be used to tighten screw ①.
2. Make sure that the moving part of the erase head assembly moves smoothly around the pivot of screw ② and also confirm that there is enough clearance (A) in the play mode.
3. Next, make an operational adjustment. Load a C-120 cassette and adjust the height of the erase head by turning screw ②. Watching that the tape does not curl at the guides of both the combination and erase heads is indication of proper adjustment.

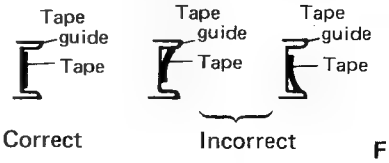

Fig. 11

NOTES: * After adjustment, confirm by ear that recorded sounds on the metal tape are completely erased.
* After replacement of the erase or record/playback head, slacken the associated wire, clamp the new head, then confirm that this new head performs normal operation.

4. Adjusting record/playback head azimuth
Adjust the head angle with the screw (1) until the reading of the electronic voltmeter becomes maximum for both channels.

Item	Adjustment	Adjusting point	Standard value	Remarks
Checking playback torque	Employ a torque testing cassette tape for the checking.		40 – 70 gr-cm	If the standard torque is not obtained, replace the take-up disc assembly.
Checking fast forward torque	Measure the torque in the fast forward mode in the same manner as in the above.		More than 80 gr-cm	If the standard torque is not obtained, clean the motor pulley, idler disc circumference.
Checking rewind torque	Measure the torque in the rewind mode in the same manner as in the above.		More than 80 gr-cm	
Checking wow and flutter	Connect a wow and flutter meter to LINE OUT terminals. Play back the VTT-656A-S test tape. Check to see if the reading of the meter is within 0.019% (WRMS).			

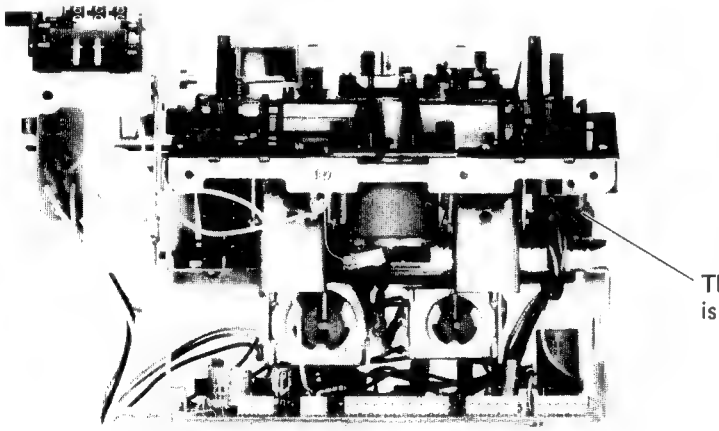

Fig. 12

Damping gear oil

Oil employed – Torque grease specified by JVC (KANTO KASEI GP-608V)
Applying method – Apply in both concaved sections as shown in the figure 13.

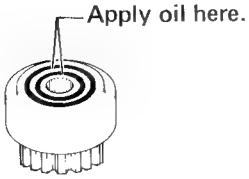

Fig. 13

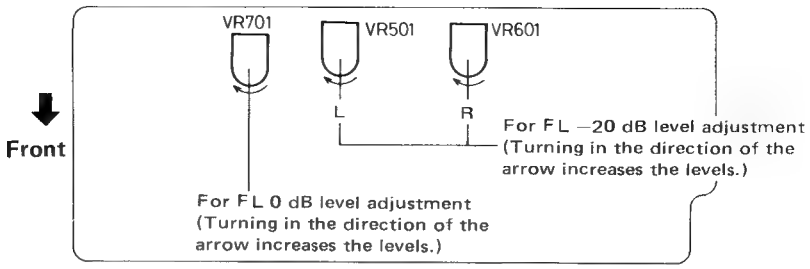

Fig. 16

[IV] Electrical circuit adjustment procedure

The DD-9 employs a combination record/playback head, thus permitting monitoring the sound being recorded. For adjustment, playback of the recorded sounds is therefore possible simply by switching the MONITOR switch from SOURCE to TAPE. (It is unnecessary to rewind the tape.)

In the steps marked by an asterisk (*), adjustment should be performed, however, only checking is sufficient with steps other than those.

Adjustment should be performed in the order of steps, 1, 2, 3, . . . Perform this adjustment with the Dolby C NR switch set to OFF and output level control set to maximum.

Step	Item	Adjustment	Adjusting point	Standard value	Remarks
1*	Decoder (playback) calibration Dolby C adj.	1. Off the Dolby NR switch. 2. Apply a 400 Hz signal to PB head terminal (PB level adj. VR set to some position). Adjust input signal so that TP101 output level becomes −2.5 dBs. 3. Adjust VRA01 and B01 so that TP102 output level becomes −2.5 dBs. 	PB level adj. VRA01 B01	−2.5 dBs −2.5 dBs	
2*	Adjusting playback level	1. Play back the VTT-664 Reference tape (1 kHz) with the tape select switch set to the SF/NORM position. 2. Adjust VR101 and VR201 until the LINE OUT becomes −4 dBs.	VR101, 201	−4 dBs (0.5 V)	This adjustment becomes necessary when a change in playback level results (for example, due to head replacement).
3*	Playback frequency response	 Step / R100 / C100: 1 O X; 2 O O; 3 X O O = connection X = open When soldering of pattern slit (R100, C100) open as 1 → 2 → 3 steps, gain of 10 kHz frequency response increases 0.5 dBs with one step.			

Step	Item	Adjustment	Adjusting point	Standard value	Remarks
4*	FL (Fluorescence Level) indicator sensitivity	1. Set the METER switch to VU. 2. Set the MONITOR switch to SOURCE, then apply a 1 kHz signal of around −20 dB to the R-ch and L-ch of the LINE IN terminals. 3. Adjust the INPUT LEVEL control so that the output level at the LINE OUT terminals is −4 dB. 4. Adjust VR701 ("0" dB level adjustment) so that "0" dB lights at both R and L. At this time, "0" dB must go out at both R and L with the input ATT (attenuation) level lowered by 0.5 dB. 5. Lower the input ATT level by 20 dB. 6. Adjust VR501 (L-ch) and VR601 (R-ch) so that "−20" dB lights at both R and L. At this time, "−20" dB must go out at both R and L with the input ATT level lowered by 1 dB. 7. Repeat steps 4.– 6.	VR701, VR501, VR601	0 VU −20 VU	Due to parts replacement.
5*	Encoder (recording) calibration Dolby C adj.	1. Off the Dolby C NR switch. 2. Apply a 400 Hz signal to LINE IN. (Balance VR set to center, and input level control set to some position.) 3. Adjust input signal so that TP103 output level becomes −2.5 dBs. 4. Adjust VRA02 and B02 so that TP104 output level becomes −2.5 dBs.	VRA02 B02	−2.5 dBs	6*	LINE IN level L-ch and R-ch deflection adj.	1. Balance VR set to center, and input level control set to max. 2. Adjust input signal so that output level of L-ch monitor becomes −4 dBs, and then adjust VR1 so that output level of R-ch monitor becomes −4 dBs.	VR1	−4 dBs	
7*	Checking record/playback frequency response	Record 1 kHz, 50 Hz and 12.5 kHz signals at an input level of 0 VU to −20 dB. Play back the tape. Check to see that the 50 Hz and 12.5 kHz signal output deviations fail within the standard range, using the 1 kHz signal output as a reference. 	For SF/NORM tape; VR107, 207 For SA/CrO2 tape; VR108, 208 For Metal tape; VR109, 209	Reference frequency; 1 kHz 0 ± 3 dB at 50 Hz 0 ± 3 dB at 12.5 kHz	This checking should be performed for normal, chrome and metal tapes and for both right and left channels. 1. Bias current adjustment for a cassette deck should generally be performed referring to the record/playback frequency response of a cassette deck depends more greatly upon the bias current than does that of an open reel deck. The current measuring method described below in an alternative one. 2. If the bias current is not properly adjusted, the record and playback characteristics become as shown left.
8	Adjusting recording level	1. Apply a 1 kHz, approx. −10 dB signal to the LINE IN terminals. Adjust the recording level controls until the signal is available at −4 dBs at the LINE OUT terminals. 2. After checking to see if the FL indicator becomes 0, record the signal applied to both left and right channels using normal tape. 3. Play back the recording part. Perform the recording signal adjustment with VR105 and VR205 so that the FL indicator becomes 0.	VR105, 205	0 VU	The level difference between left and right channels for SF/NORM tape, chrome tape and metal tape should be less than 1 dB (1 VU). Perform the adjustment using a normal tape, level difference between recording and playback for SA/CrO2 and metal tapes, should be less than 1.5 dB, and that between left and right channels should also be less than 1 dB.

Step	Item	Adjustment	Adjusting point	Standard value	Remarks
9	Checking record/playback signal distortion	1. Record a 1 kHz, −4 dBs signal to LINE IN terminals and perform recording with the FL indicator becomes 0. 2. Play back the recorded part. Check the output with a distortion meter to see if the value conforms to the standard value.		SF/NORM tape; Less than 2.5% SA/CrO_2 tape; Less than 3% Metal tape; Less than 2%	Be sure to perform this adjustment following bias current and recording level adjustments.
10	Checking signal to noise ratio in record/ing/playback	1. Record a 1 kHz, 0 VU signal. Stop the input by disconnecting from the terminal to perform non-signal recording. 2. Play back the recorded part. Measure the 0 VU recording output and the non-signal recording output for comparison using an electronic voltmeter. Check to see if the value conforms to the standard value.		S/F NORM, SA/CrO_2 and Metal tapes; More than 42 dB	Apply an output (−72 dBs) to the MIC terminals with the recording level controls set to maximum so that the FL indicator becomes 0.
11	Checking erasing coefficient	1. Apply a 1 kHz signal to the LINE IN terminals. Adjust the recording level controls until the FL indicator becomes 0. 2. Perform recording with the signal enhanced by 20 dB. 3. Erase a part of the recording. 4. Measure the output difference between the erased part and non-erased part to compare with an electronic voltmeter.		More than 65 dB	For the measuring, connect a band pass filter between the deck and the electronic voltmeter. 
[V] Adjustment by computer checker

Use the checker for DD-9 (specified by JVC).

■ **Adjustment conditions** (connection of checker, its switch positions, etc.)

■ **Adjustment procedures**

(1) Computer clock adjustment
Connect a counter to ICG02 P1 (TP CLOCK), then turn the core of TG03 so that the oscillation frequency becomes 400 kHz. (In this case, connect a 1 MΩ resistor in series with the counter input.)

(2) Computer preset check
At each tape position, confirm that each bit is equal to the pertinent value in the table below.

	Bias	Sensitivity	Medium-frequency equalization	High-frequency equalization at L/R
Normal	14	7	3	4
FeCr	14	8	3	5
Metal	9	8	4	11
CrO_2	14	7	3	5

Notes: ● Concerning the FeCr position, set the TAPE SELECT switch to CrO_2 with Normal or FeCr tape.
● Concerning the CrO_2 position, set the TAPE SELECT switch to CrO_2 with CrO_2 tape.

(3) Computer oscillation adjustment
When pressing the START switch with the set (DD-9) in the STOP mode, the oscillation switching program starts.
The START switch not pressing, signals are repeatedly emitted in the order of 1 kHz – 4 kHz – 8 kHz – 12.5 kHz – 1 kHz at intervals of about 1.5 sec.
Connect an electronic voltmeter to tab 55 (A/D IN) on the computer board, adjust the oscillation level for each frequency by the pertinent half-fixed resistor.

Frequency	Half-fixed resistor	Adjustment value
1.0 kHz	VRG04	–27 dB
4.0 kHz	VRG03	–28 dB
8.3 kHz	VRG02	–27 dB
12.5 kHz	VRG01	–25 dB

Note: When pressing the START switch in arbitrary output mode, it is possible to keep this output mode.

(4) A/D adjustment
With the START switch pressed and the set in the STOP mode, confirm that the A/D counter operates.
Next, connect an oscilloscope (DC couple) to the A/D test point, then confirm that the waveform shown at right appears.
Adjust VRG05 so that the indication of the A/D counter is 64.
When releasing the START switch, the sensitivity switching operation is performed.

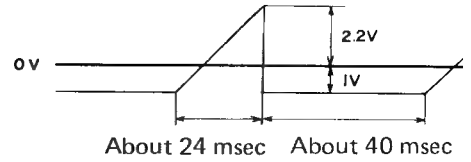

Fig. 17

(5) Sensitivity and medium-frequency equalization level switching operation
When releasing the START switch after A/D adjustment, confirm that the bit for SENS, switches.
Next, confirm that the bit for M. EQ switches, remove post pin (3) and connect an electronic voltmeter to tabs 111 and 211. Then, confirm that the output changes step by step.

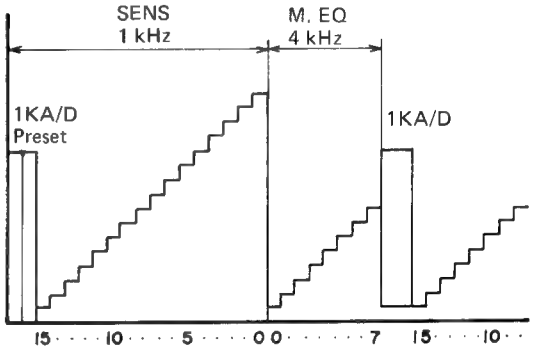

Fig. 18

(6) Bias adjustment
Press the START switch with the set in the STOP mode, then confirm that the bit for BIAS switches from 15 through 0.
Next, put the set into the REC PAUSE mode, then confirm that the record head current changes step by step.

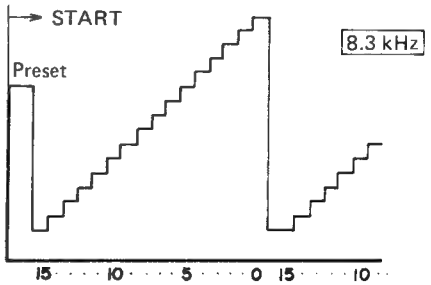

Fig. 19

Note: Set the bias for metal tapes (adjust VRG06) and adjust the oscillation frequency.
● Adjust VRG06 so that emitter voltage of XG04 becomes 10.6 V.
● Adjust TG01 so that bias frequency becomes 95 kHz.
● Adjust TG02 so that bias tuning becomes peak point.

(7) High-frequency equalization level switching operation
With the set in the STOP mode, remove bias cut pin (8) on the computer board. Press the START switch, then confirm that the bit for H. EQ. switches.
Next, with the set in the REC PAUSE mode, confirm that the head current changes step by step.

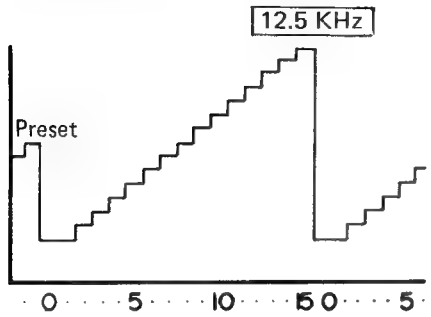

Fig. 20

(8) Computer playback gain adjustment
Using a 1 kHz reference playback tape with the set in the STOP mode, push up the AR switch and press the START switch. Then, release the AR switch after confirming that the set has begun the test program.
Next, remove post pin (9) on the computer board. After confirming that the output level at LINE OUT is −4 dB, connect post pin (9) as before, connect an electronic voltmeter to tab [55] on the computer board, then adjust VRA03 and VRB03 on the main amplifier board so that the output level is −10.5 dB. The output at R channel goes OFF, when the MONITOR switch is ON and the output at L channel is OFF.

(9) Record/playback check in computer switching operation
Remove post pin (9) on the computer board, apply a singal of −20 dB to LINE IN and select a suitable test program.
Next, press the START switch after stopping the input at each operation, then change the REC mode to the PLAY mode.
Enter a frequency corresponding to each test program, then check the output. (Set the Dolby C NR switches to OFF and use the normal UD tape.)

Standard Voltage Value

Voltage values are measured by the following meter without input signal at recording mode.

C. Tester = Circuit Tester (20 kΩ impedance)
E. Voltmeter = Electronic Voltmeter

Tape select switch : NORM
Dolby C switch : OFF

Mechanical Component Parts List

Ref. No.	Parts No.	Parts Name	Remarks	Q'ty
1	VKL1184-00B	Chassis Base Ass'y		1 set
2	VKL4823-001	Brake Bar		1
3	VKW4243-001	Brake Bar Spring		1
4	VKZ4129-001	Rubber Tire		2
5	VKZ4005-003	Stopper		1
6	VKL4824-001	Lock Plate (1)		1
7	VKS4233-001	Lock Bush		3
8	VKL4945-001	Slide Plate		1
9	VKW4191-001	Pressure Lever Spring		1
10	VKS4258-00C	Connecting Lever Ass'y		1
11	VKS4260-00B	Lock Lever Ass'y		1
12	VKL4827-001	Lock Plate (2)		1
13	VKS4262-001	Pause Lever		1
14	VKL4828-00A	Play Arm Ass'y		1
15	VKS2110-002	Switch Holder (L)	Left	1
16	VKS4263-001	Pressure Lever		2
17	VKS4264-001	Switch Lever		1
18	VKH4196-001	Shaft		1
19	VKW4138-001	Pressure Lever Spring		3
20	VKS3125-001	Switch Holder (R)	Right	1
21	VKH4196-001	Shaft		1
22	VKS4265-002	Cassette Switch Lever		1
23	VKL4944-001	Stopper		1
24	VKL4874-00A	Slide Base Ass'y		1
25	VKZ4129-001	Rubber Tire		1
26	TJN265559-02	Silencer		1
27	VKP4113-00A	Pinch Roller Arm Ass'y		1
28	VKW4240-001	Pinch Roller Spring		1
29	VKS4266-001	Shift Lever		1
30	VND4020-001	Head Plate	for R & P Head	1
31	VGH0425-301	R & P Head Ass'y		1
32	ZMM090424-0A	E. Head Ass'y		1
33	THC037417-02	Head Plate	for E. Head	1
34	VMZ0008-00A	Wire Ass'y		1
35	VKL3155-00A	Reel Disk Bracket Ass'y		1
36	VKR4113-00C	Take-up Reel Ass'y		1
37	VKR4118-00B	Supply Reel Ass'y		1
38	VKS4130-001	Back Tension Base		1
39	VKS4131-002	Reel Stopper		2
40	VKS4151-00D	Idler Ass'y Unit		2
41	VKW4134-001	Idler Spring		1
42	MDN-7V1-3	Reel Motor		1
43	VKR4121-001	Motor Pulley		1
44	VKL4832-001	Shaft Holder		1
45	VKL4832-002	"		1
46	VKL4833-001	Solenoid Lever		1
